GPT5 Pro Research Portfolio V6 Analysis V2 9-14

AI-2027 Event Horizon Fund – Final Allocation & 2026–2030 Outlook

Executive Summary

The **Event Horizon Fund** (approximately 50% of total capital) is being optimized to maximize returns under the "AI-2027" scenario – a world where **exponential AI compute demand collides with hard physical constraints**. The revised portfolio concentrates on the **critical bottlenecks** in this AI boom: power generation, advanced chip manufacturing capacity, high-end semiconductor equipment, memory (HBM), networking, and cooling. These are the choke points with **durable pricing power** as AI demand outstrips supply*[1][2]*. We add selective upstream exposures (EDA software, strategic materials) to hedge supply-chain risks, and we maintain a 10% Moonshot sleeve for asymmetric tail outcomes.

Base-Case Performance: If the AI-2027 scenario plays out as expected, the Event Horizon Fund is projected to **compound at very high rates through the late 2020s**, roughly **+35–45% annual returns in the next 2–3 years, tapering to ~15–20% by 2029–2030** as the build-out matures*[3]*. This trajectory would approximately **quadruple** the fund's value by 2030. The biggest contributors to performance will be stocks that control the **binding supply constraints**: e.g. **Constellation Energy** in nuclear power (forecasting ~50–60% annual surges in peak years)*[4]*, **Micron** in memory (~+70% in supply-crunch years)*[5]*, **NVIDIA** in AI chips (~+60% late-decade)*[4]*, and **Vertiv** in data center cooling (~+55–60%)*[4]*. These names anchor the portfolio and drive its upside. The end result is a more concentrated, high-conviction fund targeting **optimal total return** if our AI boom thesis comes to fruition.

AI-2027 Scenario: Demand Explosion vs. Physical Limits

Under the AI-2027 base-case scenario, **demand for AI compute grows at unprecedented rates, while key enablers face inelastic supply**. For example, state-of-the-art AI chip production is projected to grow ~80% CAGR (from ~7.7M units in 2025 to 92M+ in 2030)*[6]*, and the AI chip market value soars from $255B in 2025 to ~$3T in 2030*[7]*. **However, supply of critical inputs lags badly:** leading-edge wafer capacity (<5 nm) expands only ~16% CAGR*[1]*, and advanced packaging capacity (CoWoS) about ~71% CAGR*[8]* – not enough to catch up

with chip demand. By 2030, **AI could consume virtually 100% of all <5 nm foundry output***[9]*, effectively cannibalizing other tech industries. This extreme supply-demand divergence gives monopoly suppliers like TSMC enormous pricing power.

The most acute bottleneck is **power**. AI data centers' power consumption is on track to hit 434 GW by 2030 (108% CAGR)*[2]* – a **"physics limit"** constraint, given new power plants and grid infrastructure take years to build. Securing 24/7 electricity (especially carbon-free) becomes a strategic imperative. Likewise, **memory (HBM)** and **advanced cooling** emerge as hard limits: each new NVIDIA GPU generation consumes more silicon area, more memory stacks, and **far more watts**, creating a *"compounding scarcity"* feedback loop*[10]*. In short, the scenario is one of **explosive demand slamming into constrained supply** across chips, materials, and energy. This portfolio is designed to own the **choke-point assets** that everyone will bid up as AI demand outstrips supply – the foundries, equipment makers, power producers, etc., rather than the "end-product" buyers of scarce GPUs*[11]*.

Portfolio Strategy: Focus on Bottlenecks & Durable Profit Pools

To capitalize on this environment, the Event Horizon Fund (EHF) is structured into thematic **"sleeves"**, each targeting a critical layer of the AI value chain where supply is tight and pricing power is high. Roughly 80–90% of the fund is allocated to these high-conviction core themes, with **deliberate avoidance of over-crowded trades** (we are *not* chasing the highest-flying AI software or model developers, nor over-weighting expensive GPU stocks). Instead, we favor the upstream "picks and shovels" supplying the AI arms race, especially those with **oligopolistic markets or irreplaceable assets***[12]*. The remaining ~10–20% of the fund rounds out exposure to governance and security (for AI operational risks) and holds a **Moonshot sleeve (10%)** of defined-risk option positions for asymmetric upside (this tail-risk sleeve is kept capped and separate, so it cannot drag down the core more than its allotted 10%). The Moonshot positions target infrequent but massive payoffs (e.g. a breakthrough by Intel, a major AI cloud deal for our crypto miners, a defense contract for autonomous drones, or an AI-accelerated pandemic scenario) while **capping downside to that 10%***[13]*.

Key strategic shifts in this optimized portfolio: We have **increased concentration** in the highest-conviction bottleneck areas – **Energy (power generation)**, **Semiconductor Capital Equipment**, and **Data Center Thermal/Integration (cooling)** – where new data underscored even greater scarcity and pricing power than previously thought*[14][15]*. We also introduced two *new upstream sleeves* in prior revisions – **Electronic Design Automation (EDA)** and **Strategic Materials** – to hedge indispensable inputs (chip design software, and rare-earth minerals) that were not previously covered well. Finally, we **shifted the data center "servers" allocation toward established integrators** (like Dell) and away from smaller OEMs, aligning with the market's transition from a "speed-to-market" phase (where niche players thrived) to a **"scale-of-deployment" war best won by large incumbents with global supply chains***[16][17]*. In practice, this meant replacing a prior position in Super Micro (SMCI) with Dell, and trimming

secondary server/component names (HPE, Flex, nVent) to double-down on the leaders (Vertiv and Dell)*[18][19]*. The end result is a more **concentrated and simplified portfolio**: we pruned several small positions and reallocated into our top convictions, pushing many of those to ~5–15% weights (while respecting a 15% cap per stock).

Risk posture: This portfolio is aggressive in pursuit of the AI thesis – it is **not** diversified by normal standards (it's heavily tech-centric and even within tech, focused on hardware/infra). However, it is diversified *within the AI build-out's value chain*, spanning from upstream R&D tools to electricity to defense. If the AI megatrend materializes as expected, these picks should outperform broad markets by a wide margin. If the thesis breaks (e.g. geopolitical disruption, AI demand falters), the portfolio would suffer, but we have some built-in hedges (e.g. **MP Materials** as a geopolitical hedge, **Moderna** as a bio-risk hedge, *and the Moonshot sleeve's* put-spread structures in some cases). Overall, the allocation tilts toward where we see **the most durable, non-substitutable profit pools** in an AI-saturated economy.

2026–2030 Performance Outlook by Theme and Top Holdings

Even within a generally booming scenario, we expect **certain themes to vastly outperform in specific years**, corresponding to when their constraint bites hardest. Below we outline each core sleeve's allocation, role, and expected performance trajectory under the AI-2027 base case:

- **Foundry & Advanced Packaging – 12% of EHF (TSMC – 12%)**
  Thesis: TSMC is the *physical gatekeeper* of AI progress – virtually all cutting-edge AI chips must be made using TSMC's leading-edge nodes *and* its advanced 2.5D packaging (CoWoS). As AI demand explodes, TSMC's capacity remains scarce. By 2029–30, **AI could consume >90% of all <5 nm wafer output***[20]*, forcing other industries aside and allowing TSMC to charge premium prices. CoWoS packaging capacity is growing fast (~71% CAGR) but still lags chip demand, **ensuring a chronic shortage***[8]* that only TSMC (monopoly provider of CoWoS) can solve.
  Performance: We expect TSMC to deliver **strong, steady gains** throughout the period as it monetizes this imbalance. In big AI ramp years (e.g. 2027 or 2029), TSM could see ~40%+ returns*[21]*. Even in "slower" years, high demand from hyperscalers keeps growth in the mid-teens. By 2030, TSMC should still be growing earnings as it brings 2 nm online. **Key drivers:** hyperscaler capex cycles and continued node shrinks (N3 → N2). **Risks:** Geopolitics (Taiwan) and any missteps by TSM or breakthrough by an alternative (e.g. Intel, though unlikely near-term). Conviction remains *very high* – we kept TSM at a full **12% weight** (unchanged) as a foundational holding. It may not be the fastest horse, but it's one of the **surest bottleneck bets** in the entire AI theme*[22]*.
- **Semiconductor Equipment (WFE) – 11% (ASML – 8%, AMAT – 3%)**
  Thesis: If TSMC is the bottleneck operator, the **equipment makers are the bottleneck**

suppliers – and arguably an even more fundamental choke point. Every new fab in the world (whether in the US, EU, or Asia) must buy tools from the **same tiny oligopoly** of WFE companies*[23]*. The AI chip boom plus government onshoring (CHIPS Act, etc.) is triggering construction of many parallel fabs globally, *all* dependent on ASML, Applied Materials, Lam, KLA, etc.*[24][25]*. We expect WFE demand to be robust for many years, and these companies' pricing power to rise (e.g. ASML's EUV machines are essentially a **100% monopoly** product with years-long waitlists*[26]*).

Performance: We simplified this sleeve to **focus on the top two** names: **ASML** (8%) and **Applied Materials** (3%). ASML, as the sole EUV provider, should have **outsize growth** – we project ~30–40% returns in the next couple of years (as High-NA EUV is adopted) and still ~15–20% p.a. by 2029–30*[27]*. Applied Materials provides a more diversified (and U.S.-centric) equipment exposure; we expect ~25–35% annual gains in the early years tapering to mid-teens later*[28]*. We **removed Lam Research and KLA** (previously 2% + 1%) to concentrate our bet on ASML's unique monopoly and AMAT's broad portfolio – this increases our **weight in the WFE sleeve from 10% to 11%**, with the incremental emphasis on ASML*[29][30]*. Both ASML and AMAT are poised to benefit from the multi-year fab expansion and the **arms race for capacity** (e.g., ASML's order book remains at record highs). **Risks:** Export restrictions or a tech slowdown; we monitor for any non-EUV lithography breakthroughs (very unlikely)*[31]*.

- **Accelerators & Custom Silicon – 10% (NVIDIA – 7%, Broadcom – 3%)**

  Thesis: We maintain significant (but somewhat reduced) exposure to AI chip designers, focusing on **NVIDIA** as the dominant GPU/accelerator provider, and **Broadcom** as a key partner for custom AI ASICs. These companies sit at the top of the AI value stack and directly capture the explosive growth in AI model training and deployment. However, we intentionally **underweight end-product chips** relative to the supply-chain plays, because we expect more competition and some margin pressure over time on the accelerators. That said, NVIDIA's roadmap (Blackwell, etc.) virtually guarantees demand for more H100-class GPUs, and Broadcom's unique position (supplying custom chips like Google's TPUs and potentially OpenAI's new chips*[32]*) makes it a stealth winner as well.

  Performance: NVIDIA remains a **growth powerhouse** in our scenario – even after its massive 2023 run-up, our base case shows NVDA still achieving **~50–60% annual returns in the late 2020s** as AI adoption broadens*[4]*. (For instance, NVDA could see ~+64% in 2027 and +59% in 2030 according to our model*[5][4]*.) We trimmed NVDA slightly from 9% to **7%** of the fund to fund other bottlenecks, but it is still one of the largest single positions – reflecting that while we aren't *over*paying for GPUs, we also can't ignore NVDA's central role. Broadcom (AVGO) was increased from 2% to **3%**, as its role in custom silicon (ASICs for cloud giants) provides upside; we expect AVGO to return ~40–50% in strong AI investment years (it was highlighted at ~+47% in 2029 in our model)*[33]*. **Changes:** We **removed AMD (1%) and ARM (0.5%)** entirely*[34][35]*. This reflects a conviction that NVDA will retain the lion's share of accelerator economics, and Broadcom's ASIC pipeline is a better complementary play than AMD (which, while a credible second source for GPUs, is likely to remain a step behind in this fast race). By

dropping smaller weights in AMD/ARM, we free capital for higher-conviction areas without materially reducing our AI exposure.

- **Memory (HBM) – 7% (Micron – 7%)**
  Thesis: The **High-Bandwidth Memory (HBM)** oligopoly (essentially Micron, Samsung, SK Hynix) is a textbook bottleneck. HBM chips are absolutely required for AI accelerators, and our forecast shows **HBM supply remaining the binding constraint on AI chip shipments through at least 2026–2028***[36][37]*. In other words, you can't ramp AI clusters faster than you can get HBM stacks. Micron (MU) is our chosen play here as a U.S. player with aggressive HBM roadmap execution.
  Performance: We expect Micron to be one of the **highest-return stocks in the portfolio** over this horizon. In the scenario, Micron's stock surges whenever the HBM shortage bites: e.g. our model shows **+70% in 2027** and **+69% in 2029** for MU*[5][33]* (these are the years when new AI chip launches drive HBM demand beyond supply). Even in off-cycle years, we still see ~15–20% gains. To capitalize on this, we **boosted Micron's weight from 6% to 7%**. This small **+1% tilt to MU** (funded by tiny trims elsewhere) is projected to add roughly **30–50 bps to annual portfolio returns in 2027–2030***[38]*. Given Micron's pivotal role in the AI memory market and its successful transition to high-margin specialty memory, we view this as a very attractive risk/reward. **Risks:** Execution (yield issues on new HBM generations) and cyclicality – but the AI-driven demand appears to be structurally insulating HBM from the typical PC/phone memory downturn.
- **Data Center "Rack-Scale" Integration & Cooling – 14% (Vertiv – 8%, Dell – 6%)**
  Thesis: This sleeve targets the **physical deployment of AI infrastructure** – essentially, building and equipping the racks and servers that house AI clusters. As we move from prototype deployments to **mass roll-outs of AI capacity**, companies that can deliver integrated, power-dense solutions at scale should thrive. **Vertiv (8%)** is our pure-play on advanced data center cooling and power systems (their specialty is liquid cooling and power distribution for high-density racks). **Dell (6%)** is our pick for server integration at scale – Dell's global supply chain and enterprise relationships position it to supply AI servers by the tens of billions of dollars*[16]*. (Dell has already guided to **$20B in AI server revenue for FY26***[39]*.) We eliminated smaller players – **HPE, Flex, nVent (total 5% removed)** – to concentrate on Vertiv and Dell, which we believe are the winners as the market shifts to large-scale deployment contracts*[18][19]*.
  Performance: **Vertiv (VRT)** is expected to have *explosive* near-term performance. The power density of new AI chips virtually mandates liquid cooling – by 2026–2027, hyperscalers will be adopting liquid cooling for a majority of new AI racks*[40]*. Vertiv, as a leader in this niche, is seeing orders surge. We project **+65% in 2026 and +45% in 2027** for Vertiv's stock*[41]*, as its backlog and earnings leap, with more moderate growth (~20% or so) later as the industry standardizes on its solutions*[41]*. We increased VRT from 7% to **8%** of the fund to reflect this high conviction. **Dell**, meanwhile, provides a more value-oriented but still high-upside play: we anticipate **+50–55% in 2025–26** (as its huge AI server backlog converts to sales)*[42][43]*, and then ~+25–35% annual returns through 2028 before moderating*[43]*. We raised Dell from 4% to **6%** – a substantial position – because it offers a rare combination of scale, reasonable valuation, and direct

AI exposure. This sleeve's **overall returns should be among the strongest in the early years** of the scenario: for instance, Rack-Scale/Cooling is modeled to return **~+58% in 2026** (the single best sleeve that year) as the first big wave of retrofitting and orders hit*[44]*. **Risks:** For Vertiv – execution and any competitor inroads (we'll watch if any rival wins >50% of new big cooling contracts, which hasn't happened yet)*[45]*. For Dell – the risk is that AI demand shifts to cloud ODMs or slows, but so far Dell is *increasing* market share in enterprise AI servers.

- **Networking Fabric – 5% (Arista Networks – 5%)**
  Thesis: High-performance networking inside AI datacenters is a critical, often overlooked bottleneck. As AI cluster sizes grow, the traditional proprietary networks (like InfiniBand) are giving way to **open Ethernet-based architectures**, which allow scaling out with standard hardware*[46]*. **Arista Networks (ANET)** is the clear leader in cloud data center switching, and it has leaned into AI networking (with 400G/800G switches and routing gear tailored for GPU clusters). We see networking as another " picks and shovels" play on AI: no matter which model or cloud wins, they all need fast interconnects.
  Performance: We consolidated this sleeve to just Arista (previously 6% ANET + 1% Marvell). **Arista (5%)** is projected to grow rapidly alongside AI cloud build-outs. We model **~+38% in 2026, +32% in 2027** for ANET*[47]*, moderating to ~20% by decade's end as 800G/1.6T Ethernet adoption matures. Arista should also see a second wave of growth if AI networks move to even larger distributed training (which requires even more switch gear per compute unit). We dropped **Marvell (1%)** entirely*[48]* – Marvell does supply ASICs for optical interconnects, but its role is smaller and its stock didn't warrant separate allocation once we decided to trim the fabric sleeve from 7% to **5%** total. Arista's dominance and focus make it the better vehicle. **Risks:** Cloud giants developing in-house switching or a major shift to white-box networking could pressure Arista (we watch for any such moves, but Arista's deep embedding at companies like Meta suggests it's secure for this cycle*[49]*).
- **Electronic Design Automation (EDA) – 4% (Synopsys – 4%)**
  Thesis: EDA software is the **blueprint layer** of the chip industry – every AI chip (GPU, ASIC, memory, etc.) must be designed and verified using EDA tools. The EDA market is a **duopoly (Synopsys and Cadence)** with high margins and *recurring revenue*, since chipmakers pay annual licenses. Importantly, the AI trend is spawning a *huge wave of custom silicon projects* (every hyperscaler is designing AI accelerators, networking chips, etc.), massively expanding the EDA TAM*[50][51]*. Synopsys (SNPS) was a smaller holding (3%); we view it as an "arms dealer" that benefits no matter which chips win, so we increased it modestly.
  Performance: **Synopsys (4%)** won't have the flashiest returns, but it provides steady growth with low risk. We expect **~+25–30% annual returns** in the next couple of years while the AI ASIC boom is hot*[52]*, then ~15–20% as it normalizes (still above what we'd expect from broad tech). In other words, SNPS offers **stability** in a volatile sector – it's not cyclical like semiconductors, and it doesn't depend on one big win. We raised the EDA sleeve from 3% to **4%** (still modest) mainly to ensure we capture this critical piece of the value chain. **Risks:** The primary risk is competitive; Cadence is the other duopoly

member (we considered splitting the position, but Synopsys has a slight edge in our view). Another minor risk is if new AI-driven chip design paradigms reduce the need for traditional EDA, but so far Synopsys is actually *embracing AI in its tools* (e.g. Synopsys.ai) to maintain its lock-in*[53]*.

- **Energy & Power (Generation & Grid) – 17% (Constellation Energy – 15%, Quanta Services – 2%)**
  Thesis: **Power is the ultimate bottleneck** in the AI era. The staggering 108% CAGR in AI power demand means *electricity availability* will constrain AI deployment, likely before silicon does*[2]*. We've identified nuclear power and high-voltage grid infrastructure as the key pinch points. **Constellation Energy (CEG, 15%)** operates the largest fleet of nuclear plants in the US – these provide 24/7 carbon-free power, exactly what hyperscale AI data centers need*[54][55]*. In a power-constrained world, existing nuclear plants (which cannot be built quickly) become **irreplaceable strategic assets** rather than commodity producers*[15]*. **Quanta Services (PWR, 2%)** is a leading engineering/construction firm for electrical grids – it builds the transmission lines and substations needed to deliver all that power to the data centers.
  Performance: We have **dramatically increased** this sleeve (from 14% to **17%**, making it the largest sleeve) because the data shows power will be the hardest constraint. CEG is now a max-size position at **15%** (up from 9%)*[56][29]*. We believe Constellation's stock will be a big winner as multi-gigawatt **PPA (power purchase agreements)** are signed with tech firms at premium rates. In fact, our base-case simulation shows Constellation as a top performer in multiple years: e.g. **+53% in 2027** and **+50% in 2030***[5][4]* (when power shortages start to really bite), with strong ~24–31% gains other years*[57]*. It carries the highest conviction in the portfolio. Quanta (2%) we kept at roughly its original weight (slightly trimmed) – Quanta's growth (~+25–35% annually mid-decade*[58][59]*) is robust but less explosive; however, it's a *critical enabler* (you need transmission lines to use that generation). By holding Quanta, we capture some upside from the massive grid investments coming (in the scenario, regulators fast-track high-voltage line projects to support AI data centers). **Risks:** For CEG – any policy changes capping rates, or a breakthrough in energy storage that suddenly makes intermittent renewables as reliable as nuke (not expected before 2028)*[60]*. For PWR – project delays or utility CAPEX slowdowns (not likely if AI demand continues, but we watch backlog growth closely). Overall, this sleeve carries **Highest Conviction** – the AI power crunch is a "must solve" problem with multi-year lead times, virtually guaranteeing pricing power for those who have generation capacity*[15]*.
- **AI-Native Security – 2% (CrowdStrike – 2%)**
  Thesis: As AI systems proliferate, they introduce new cyber vulnerabilities (e.g. model theft, data poisoning) and also empower attackers. **Cybersecurity tailored for AI and cloud environments** will be a non-discretionary spending area for enterprises and governments*[61]*. We keep a toehold in this theme through **CrowdStrike (CRWD)** – a leader in cloud-native endpoint security that is integrating AI into its threat detection and offering products specifically to protect AI workloads. This is a smaller sleeve (2%) because while important, security isn't a *binding bottleneck* the way chips or power are – it's more of a necessary service that grows alongside the AI deployment curve.

Performance: We chose to **maintain CrowdStrike at 2%** (we did *not* increase to 3% as one earlier analysis suggested*[62]*). This reflects a balance: CRWD should perform well – our model shows ~30–40% annual returns in the next few years for CRWD*[63]* as cybersecurity budgets expand in tandem with AI rollouts (and AI-enhanced threats emerge). By 2030 that may slow to ~20% growth*[63]*. This is solid, but other areas offered even higher conviction returns, so we prioritized those for additional allocation. Still, CrowdStrike at 2% provides **exposure to the "AI security" angle** and could surprise to the upside if, say, a major AI-related breach drives a wave of spending on its solutions. **Risks:** High competition in cybersecurity and IT budget cuts in a downturn (though protection of critical AI systems likely remains priority).

- **AI Operate & Control – 2% (Palantir – 2%)**
  Thesis: This sleeve covers platforms for **AI governance, orchestration, and control** – essentially the software "operating systems" needed to deploy AI in regulated, mission-critical environments. **Palantir (PLTR)** is our pick here. Its new AIP (AI Platform) is aimed at enabling large organizations to safely harness LLMs and agentic AI with human oversight. Given the scenario's assumption of rapidly spreading AI, tools to monitor, audit, and control AI actions (and comply with emerging regulations) will be critical*[64]*.
  Performance: We **doubled Palantir from 1% to 2%** after seeing its commercial traction (93% YoY U.S. commercial revenue growth recently)*[65]*. Palantir is high-upside but also high-valuation; however, in the AI boom scenario we expect Palantir could grow into its valuation fast. Our base case has PLTR achieving **~45–50% annual returns in 2026–27** as its AIP product gains adoption*[66]*, then ~30% thereafter (still among the higher-growth software names)*[67]*. This position is small (2%) but purposeful: it gives us a stake in the *software leverage* of AI deployment (complementing our mostly hardware bets). **Risks:** If Palantir's platform doesn't become a standard and other players eat its lunch, growth could disappoint – we'll monitor its customer wins (the **"AIP bootcamp" uptake** each quarter is a key metric*[68]*). For now, momentum looks good, and we like the asymmetric potential if Palantir truly becomes the default AI control system in both government and industry.
- **AI-Enabled Defense (Military) – 2% (AeroVironment – 1%, Kratos – 1%)**
  Thesis: The AI arms race isn't just corporate – it's geopolitical. The scenario explicitly posits a fast military take-up of AI, especially in autonomous systems (drones, robotic fighters) and "affordable mass" strategies. We've dedicated ~2% to **defense contractors at the forefront of AI-driven military tech**. Our holdings are **AeroVironment (AVAV)** – known for small drones (e.g. Switchblade) and now building an AI software ecosystem (its AV Halo platform) for command-and-control*[69]* – and **Kratos Defense (KTOS)** – a leader in unmanned jet-powered aircraft (its Valkyrie drone is a prototype for the Pentagon's loyal wingman program)*[70]*. These are smaller, pure-play defense tech firms geared to the "autonomous systems" revolution.
  Performance: We did **increase each from 0.5% to 1%** (so combined military sleeve from 1% → **2%**). However, we kept the weights modest given their speculative nature (their success depends on program wins). In our base case, we actually assume relatively **moderate returns for these stocks unless/until big contracts land** –

perhaps ~25–45% annually through 2028*[71][70]*, which is good but not as high-impact to the portfolio due to small weight. Notably, our earlier model treated a lot of their upside as part of the Moonshot (tail events) – e.g. a huge DoD award for Kratos could be a "spike" event. By holding 1% each outright, we ensure we participate in the broad defense AI trend (and any steady appreciation as AI-defense budgets rise). But the really large, sudden gains (if the Valkyrie becomes a major program of record, etc.) would still register as Moonshot-like upside for the portfolio. **Risks:** These are high-risk, small-cap defense stocks – delays or loss of contracts would hurt. We have clear "reduce if" triggers (e.g. if Kratos loses out on the Air Force's drone program, we would likely exit)*[72]*. For now, both companies remain in pole position for the emerging *"loyal wingman"* category and the Pentagon's push for lower-cost autonomous systems.

- **Bio-Risk Hedge – 1% (Moderna – 1%)**
  Thesis: One often-overlooked risk of advanced AI is the potential misuse in areas like bioengineering. AI could significantly lower the barrier to designing pathogens, raising the risk of a future engineered pandemic. While not part of the *upside* thesis, this is a catastrophic tail risk that we choose to **hedge** in the portfolio. **Moderna (MRNA)** serves as a hedge/insurance: in a scenario of a future bio-event, Moderna's mRNA vaccine platform (augmented by AI design tools) would be uniquely positioned to respond quickly, likely causing its value to skyrocket.
  Performance: In the base-case (no catastrophic bio-event), we expect Moderna's stock to be fairly **flat to modest** – perhaps on the order of ~10–15% annual gains at best*[73][74]*. (Our model actually treated it as 0% in many years*[75]*, essentially assuming it just treads water absent a crisis.) We keep it at **1%** as a pure hedge. This way, if an AI-accelerated biosecurity crisis were to occur (an extreme tail scenario), Moderna could *potentially multiply* in value (as it did during COVID), providing a positive jolt just when the rest of the portfolio might be stressed. If no such event occurs, the cost to us is minimal (a 1% weight growing slowly or even lagging is not significant to overall returns). **No changes** were made to this sleeve – it remains 1% in MRNA (which we manage as a "black swan" position, re-evaluated periodically based on global risk level)*[73][76]*.
- **Strategic Materials – 3% (MP Materials – 3%)**
  Thesis: This sleeve is about **securing the supply chain's raw underpinnings**. AI hardware requires rare earth elements (for electric motors, generators, etc.), and currently China controls the vast majority of rare-earth mining and processing. This is a single-name sleeve: **MP Materials (MP)**, which operates the only integrated rare-earth mining & processing site in the U.S. (Mountain Pass) and is backed by the DoD to develop domestic magnet production*[77][78]*. The idea is that even as AI demand booms, one geopolitical move (e.g. export restrictions from China) could choke off rare earth supplies – MP is our hedge and also a play on the inevitable push to *re-shore critical minerals*.
  Performance: We kept MP at **3%** (no change in weight, though we categorize it as a core part of the portfolio now rather than an afterthought)*[79]*. MP's returns may not be spectacular in the base case – likely ~20–25% in the next couple of years, then leveling to ~15% as its new magnet facility ramps*[80]*. It's essentially a steady execution story

(we need to see them successfully move from just mining to also processing and magnet manufacturing by 2025–2026). However, MP provides **valuable downside protection**: if geopolitical tensions rise or China plays the "rare earth card," MP's strategic value (and stock) could spike. In the meantime, even base demand (EVs, wind turbines, and defense needs for rare earths) supports its growth. **No major changes** were needed here; we considered it appropriately sized at 3%. We simply note that MP is now a **core holding to hedge the "kill-switch" risk** inherent in our otherwise Asia-exposed hardware bets*[81][78]*.

- **Moonshot (Tail-Risk) Sleeve – 10% (Various LEAP options and small-cap plays)**
  Thesis: The Moonshot sleeve remains **10% of the Event Horizon Fund** (unchanged), dedicated to high-upside, *controlled-risk* positions that pay off in extreme scenarios. By design, each position here is sized and structured such that our **max loss is the sleeve's 10%** (we use debit call spreads, long-dated options, etc., so we can't lose more than we put in)*[13]*. The intent is to capture the **convex upside** of certain tail events or underdog outcomes without jeopardizing the core portfolio. Current Moonshot components include: **Intel (3.5%) LEAP call spreads** – a bet on a surprising Intel foundry comeback aided by CHIPS Act subsidies (pays off big if Intel's new nodes succeed by 2026–27); **Crypto AI Hosting (3.5%)** across CoreWeave/Compute North-related plays (CORZQ, IREN, APLD) – plays on the thesis that ex-Bitcoin datacenters get repurposed for AI cloud capacity, with major hosting contracts ("LTAs") potentially re-rating these equities 10×*[82]*; **Kratos additional calls (2.0%)** beyond the equity – levered bet on it winning big chunks of the Pentagon's autonomous drone programs (Collaborative Combat Aircraft); and **Moderna calls (1.0%)** – a bit of extra convexity in case of an AI-heightened pandemic. We periodically adjust these positions and ladder expirations, but they share the trait of **low probability, high impact payoffs**.
  Performance: In *base-case years*, we assume the Moonshot sleeve will have a slight **drag of perhaps –0.3% to –1.0% on the total portfolio** (this represents option premium decay if none of the tail events hit)*[83]*. This is acceptable "insurance cost." However, in the event one of our theses hits, the sleeve can **deliver a windfall**. For example, our analysis suggests that: an Intel success headline could add **+3–8%** to the total portfolio's value (as our call spreads revalue)*[84]*; a major AI hosting deal or funding for our data center plays could add **+4–12%***[85]*; a big defense contract for Kratos could add a few points; and a pandemic shock could add **+4–10%** via Moderna*[86]*. These would be on top of core returns. We are **keeping the Moonshot sleeve structure intact** – using mostly LEAP call spreads (pay ~35–45% of the spread width, aiming for 3–6× payouts) and some equity in the miners – and we **do not count on Moonshot in our base forecast***[87]*. It's purely upside optionality. The critical part is that this sleeve is ring-fenced at 10% – even if all these bets expire worthless, the core 90% of the fund drives our results. Conversely, if a tail event occurs, this sleeve ensures we participate in the upside rather than just suffering the downside of, say, an AI supply shock or geopolitical surprise.

Portfolio Return Drivers: Based on the above, the Event Horizon Fund is positioned such that different sleeves drive different phases of the AI rollout. In **2026–27**, as the first big AI capacity

surge hits, we expect **power and cooling** to be major drivers – e.g. **Vertiv** and **Constellation Energy** could each roughly **double by 2026–27***[41][5]*, and **Dell** and **Quanta** should also see big early jumps (50%+). **NVIDIA** and **Broadcom**, coming off already high bases, may "only" rise ~15–30% in 2026*[57][88]* before re-accelerating later. **Micron** could spike in 2027 (~+70%*[5]*) once new AI hardware launches strain memory supply. By **2028–29**, as huge data centers come online, **networking and second-wave capacity** plays step up: we see **Arista** and **Broadcom** gaining ~45%+ around 2028–29*[33]*, and **Micron** possibly another big jump (~+69% in 2029)*[33]*. **NVIDIA** regains momentum with new product cycles (potential ~+60% in 2029)*[33]*. Meanwhile, **TSMC, ASML, and AMAT** should steadily contribute ~30–40% in the mid-period then ~15–20% late – not top of the leaderboard, but given their weight, names like TSM and ASML will be among the **top contributors to total portfolio value each year***[89]*. Come **2030**, constraints tighten again (power and HBM "encore"), so we anticipate **another strong year for power and memory** – e.g. **Micron ~+64%, Constellation ~+50% in 2030***[4]*, keeping returns elevated even at the decade's end.

In summary, the base-case modeling shows **exceptional multi-year performance** for this optimized portfolio: **strong double-digit returns every year through 2030**, with several years potentially seeing 30–40%+ gains. The core 90% portfolio (ex-Moonshot) roughly **triples over 2026–2030** in our forecast*[90]*, and the Moonshot sleeve provides additional upside that could make the total outcome even better. The **chart below** (source: our scenario model) illustrates the expected annual returns for each major sleeve:

Sleeve Theme	2026	2027	2028	2029	2030
Foundry & Adv. Packaging	+40%*[91]*	+25%*[92]*	+15%*[93]*	+10%*[94]*	+10%*[95]*
Accelerators & Custom Silicon	+44%*[96]*	+32%*[97]*	+23%*[98]*	+18%*[99]*	+14%*[100]*
HBM Memory	+50%*[101]*	+25%*[102]*	+15%*[103]*	+10%*[104]*	+10%*[105]*
Semi Cap Equipment (WFE)	+41%*[106]*	+32%*[107]*	+22%*[108]*	+16%*[109]*	+12%*[110]*
EDA Software	+30%*[111]*	+25%*[112]*	+20%*[113]*	+20%*[114]*	+15%*[115]*

AI Data Center Networking	+38%*[116]*	+32%*[117]*	+24%*[118]*	+19%*[119]*	+15%*[120]*
Rack-Scale & Cooling	**+58%***[121]*	+39%*[122]*	+26%*[123]*	+18%*[124]*	+14%*[125]*
Energy & Power	+49%*[126]*	+47%*[127]*	+35%*[128]*	+24%*[129]*	+19%*[130]*
AI-Native Security	+35%*[131]*	+40%*[132]*	+30%*[133]*	+25%*[134]*	+20%*[135]*
AI Operate & Control	+45%*[136]*	+50%*[137]*	+40%*[138]*	+30%*[139]*	+25%*[140]*
AI-Enabled Defense	+35%*[141][71]*	+45%*[71]*	+30%*[142]*	+20%*[70]*	+20%*[70]*
Bio-Risk Hedge	+15%*[74]*	+15%*[74]*	+10%*[74]*	+10%*[74]*	+10%*[74]*
Event Horizon Fund (Total)	**~+35%** (est.)*[3]*	**~+40–45%***[3][90]*	**~+34%***[90]*	**~+38%***[90]*	**~+20%** (est., ex-Moonshot)*[3]*

Table: Modeled annual returns for each sleeve under the AI-2027 base case. Early years see outsized gains in infrastructure (power, cooling at +50% or more), while later years still show strong growth in memory, accelerators, and power. The total portfolio (ex-Moonshot) compounds rapidly (~35–45% in mid-2020s, tapering to ~15–20% by 2030)[3]. The Moonshot sleeve can add volatility: base-case assumes a small drag, but upside events could boost total returns significantly[143][82].

Final Proposed Allocation and Key Changes

Below is the **final optimized allocation** for the Event Horizon Fund, organized by thematic sleeve and underlying stock positions. We also detail the **changes from the current V6 portfolio** (adds, trims, removals) and the rationale for each adjustment:

Final Allocation by Sleeve & Stock (Event Horizon Fund ~100%):

· **Foundry & Advanced Packaging – 12%:** *TSMC (12%) – [no change]* TSMC remains at 12%, a cornerstone reflecting its unmatched foundry/packaging capacity*[144][9]*.

· **Accelerators & Custom Silicon – 10%:** *NVIDIA (7%)*, *Broadcom (3%) – [net –2%]* Reduced total from 12%→10%; trimmed Nvidia (9%→7%) and **removed AMD (1%) and ARM (0.5%)** to focus on the prime movers (NVDA) and custom ASIC enabler (AVGO)*[34][35]*. Broadcom increased 2%→3% on rising custom chip wins (e.g. FT report on OpenAI partnership)*[32]*.

· **Memory (HBM) – 7%:** *Micron (7%) – [+1%]* Sole HBM pure-play; raised 6%→7% to press our advantage on this binding constraint (adding ~0.3–0.5% to annual return)*[38]*. High conviction in Micron's HBM roadmap and oligopoly pricing.

· **Semiconductor Equipment (WFE) – 11%:** *ASML (8%)*, *Applied Materials (3%) – [+1% sleeve]* Consolidated into ASML + AMAT only; **removed Lam (2%) and KLA (1%)** for simplicity*[23][48]*. ASML doubled 4%→8% (ultimate EUV monopoly)*[26]*; AMAT up 3%→4% to maintain a U.S.-centric diversified tool exposure*[145]*. Total WFE sleeve from 10%→~11%.

· **EDA Software – 4%:** *Synopsys (4%) – [+1%]* Increased 3%→4% (small sleeve) to capture the surging demand for chip design tools ("arms dealer" thesis)*[51][146]*. Synopsys' stable duopoly and high margins warrant a bit more weight.

· **AI Data Center Networking – 5%:** *Arista Networks (5%) – [–2% sleeve]* Streamlined to Arista only; **removed Marvell (1%)***[48]*. Trimmed sleeve from 7%→5% as Arista's 5% position is sufficient to play the Ethernet fabric growth (ANET remains high-conviction with ~40% growth in early years)*[49][47]*.

· **Rack-Scale Integration & Cooling – 14%:** *Vertiv (8%)*, *Dell (6%) – [–2% sleeve]* Refocused on top two names; **removed HPE (2%), Flex (1.5%), nVent (1.5%)** entirely*[18][19]*. Vertiv up 7%→8% (increased conviction that liquid cooling is mandatory)*[40][147]*. Dell up 4%→6% (replacing a prior SMCI position; Dell's scale and ~$20B AI backlog make it the better "scale deployment" play)*[16][148]*. Total sleeve slightly reduced (16%→14%) after removing smaller players; results in a **tighter focus on Vertiv + Dell** as the beneficiaries of the mass deployment phase.

· **Energy & Power – 17%:** *Constellation Energy (15%)*, *Quanta Services (2%) – [+3% sleeve]* **Significantly increased** from 14%→17% as our **#1 conviction theme**. Constellation (nuclear power) raised 9%→15% – now a max-weight position, reflecting the view that power is the hardest bottleneck and CEG's assets will be revalued higher accordingly*[56][54]*. Vistra (2%) was **removed** (we choose to focus on nuclear over fossil generation)*[149]*. Quanta (grid engineering) stays ~3% of fund originally, but effectively ends at 2% here due to overall resizing – we trimmed slightly (3%→2%) to fund other moves (Quanta remains important, but secondary to generation itself).

· **AI-Native Security – 2%:** *CrowdStrike (2%) – [no change]* Left at 2% (we opted **not** to increase to 3%)*[62]*. CrowdStrike continues as our pick for AI-focused cybersecurity (strong growth, but we kept allocation moderate in favor of higher-return bottlenecks).

· **AI Operate & Control – 2%:** *Palantir (2%) – [+1%]* Increased 1%→2% to reflect Palantir's surging commercial uptake and unique positioning in AI governance software*[65][66]*. This doubles our exposure to the AI orchestration theme, which could be a dark horse winner as organizations struggle to integrate AI safely.

· **AI-Enabled Defense – 2%:** *AeroVironment (1%)*, *Kratos (1%) – [+1% sleeve]* Both raised from 0.5%→1% (sleeve from 1%→2%) to modestly increase our stake in the AI defense race*[150][151]*. We chose equal weights 1% each. These remain small positions, but now each can contribute meaningfully if their AI-driven military programs succeed (while limiting capital at risk if not).

· **Bio-Risk "Insurance" – 1%:** *Moderna (1%) – [no change]* Kept at 1% as our black-swan hedge (no change in weight or thesis). We'll carry this position as cheap insurance against an AI-accelerated bio-event, recognizing it likely won't move the needle unless that tail risk materializes*[73][76]*.

· **Strategic Materials – 3%:** *MP Materials (3%) – [no change]* Remains 3%. MP is now explicitly a core holding (previously it was in the portfolio at 3%, and we affirm that allocation). It hedges geopolitical supply risk and stands to gain from government support for rare-earth independence*[152][77]*. No change in weight was needed since 3% already reflects our desired exposure.

· **Moonshot (Tail-Risk) Sleeve – 10%:** *High-conviction LEAP call spreads & small-cap "lottery tickets" – [no change to %]* Stays at 10% of the fund by design. Current composition is unchanged: ~3.5% in INTC call-spreads (CHIPS Act/foundry turnaround bet), ~3.5% spread across CORZQ/IREN/APLD (AI data center repurposing plays),

~2.0% in KTOS calls (defense contract upside), ~1.0% in MRNA calls (pandemic hedge). We **retain all these positions** and the disciplined framework around them*[13]*. We did *consider* if simplifying the portfolio warranted folding the Moonshot into core (as one analysis suggested)*[153]*, but given the asymmetric payoff and "quarantined risk" benefits, we **decided to keep the 10% Moonshot sleeve intact**. It continues to offer cheap convexity: it could noticeably boost our total returns if a tail scenario hits, while any loss is capped at 10%.

Summary of Key Changes: In implementing the above allocation (Event Horizon Fund V7), we made the following notable changes from the prior V6 portfolio:

- **Boosted Top Bottlenecks: Constellation Energy (CEG)** – increased **9% → 15%** (+6%)*[56]*, making it the largest holding, to capture the **power shortage thesis** (108% AI power CAGR, nuclear repricing)*[15]*. **ASML** – increased **4% → 8%** (+4%)*[29]*, elevating it to anchor the WFE sleeve (ASML's EUV monopoly is indispensable to AI chip advances)*[26]*. **Vertiv (VRT)** – up **7% → 8%** (+1%)*[147]*, reflecting higher conviction that liquid cooling is a non-negotiable requirement for AI data centers (power densities make air cooling obsolete)*[40]*. **Broadcom (AVGO)** – up **2% → 3%** (+1%)*[154]* to increase exposure to custom AI silicon (recent major design wins validate its role)*[32][155]*. **Synopsys (SNPS)** – up **3% → 4%** (+1%) to slightly enlarge the EDA sleeve (securing the "arms dealer" of AI chip design)*[51][146]*. **Palantir (PLTR)** – up **1% → 2%** (+1%)*[156]*, doubling our stake in AI platform software given its accelerating adoption and strategic value as AI governance becomes critical*[157][66]*. **CrowdStrike (CRWD)** – up **2% → 3%** was considered but we left it at 2%; however, in our prior research, a +1% increase was justified by **AI-security becoming non-discretionary** spend*[62]* (we maintain high conviction but opted to allocate that 1% elsewhere).
- **Added New Upstream Exposure:** This was largely done in V6 already (EDA and Materials sleeves existed at 3% each). In V7, we **reaffirm MP Materials (3%)** as a core allocation (formerly it was just part of "strategic materials" – now it is *the* strategic materials play)*[79]*. No new tickers were added in V7; rather, we concentrated existing ones.
- **Focus the AI Infrastructure Plays:** We **reallocated within the "Rack-scale & Integration" sleeve** – **Dell +3% (4%→7%)***[148]* while **removing SMCI** (Dell effectively *replaced* a prior Super Micro position)*[16]*. In our final version we set Dell at 6% (a bit less than the 7% proposed, to balance weight elsewhere). We **eliminated HPE, Flex, nVent (combined –5% change)***[18][19]* to consolidate around Vertiv and Dell as our high-conviction plays for the "scale-out" phase. This streamlining recognizes that **Dell's execution and incumbency give it an edge** over smaller hardware integrators in filling the massive enterprise orders coming*[16]*.

- **Streamlined Semiconductor Exposure:** We **removed several small positions** to sharpen our focus on the highest-value nodes in the supply chain. Notably, **AMD (1%) and ARM (0.5%) were removed***[34][35]* – we chose to ride NVIDIA and Broadcom exclusively in accelerators, as explained. **Marvell (1%) removed***[48]* – consolidating networking into Arista (Marvell's 1.6T optical DSP opportunity is real, but Arista captures the broader fabric opportunity). **Lam Research (2%) and KLA (1%) removed** – consolidating WFE into ASML/AMAT for simplicity, without significantly impacting our exposure to overall fab equipment demand (and with Lam/KLA likely to grow more in line with industry vs. ASML's unique outsized position)*[23][26]*. This cut our stock count and put each dollar to work in our **highest-conviction vehicles** (e.g. ASML over Lam, etc.), which should improve total return potential. We also **dropped Intel's equity stake** from the core portfolio earlier (Intel was not in EHF V6 core; we only hold it via options in Moonshot). This aligns with avoiding low-probability turnaround plays in the core – we gain exposure to a hypothetical Intel success **only via the 3.5% Moonshot call-spread**, which caps our downside but gives big upside if they surprise.
- **Geographic Hedge in Tools:** We gave a slight **boost to AMAT (3%→4%)***[158]* as a U.S.-centric WFE hedge. This ensures that if export controls or domestic fab subsidies shift the competitive balance, we have a strong U.S. player alongside ASML. AMAT's weight gain also soaks up some freed capacity from removing others.
- **Power Focus – Quality over Quantity:** We **cut Vistra (2%)** entirely*[149]*, concentrating our power bet on Constellation (nuclear) and a touch of Quanta. Vistra's gas-heavy generation is a more short-term "bridge" power solution; in a 5-year view, we have greater conviction that nuclear's scarcity value will be rewarded (and Vistra's 2% was more effectively redeployed into CEG). We retained Quanta but acknowledged its role is second-fiddle to generation – this fine-tuned our Energy sleeve to be **CEG-dominated** for max impact.
- **Defense & Tail-Risk Adjustments:** We **increased AVAV and KTOS** to 1% each (from 0.5%)*[150][151]*. This reflects growing evidence that the Pentagon is serious about autonomous systems ("loyal wingman" programs, etc.), and these companies' tech is nearing deployment. By upping to 1% each, any major contract wins will at least modestly benefit our overall returns (whereas at 0.5% they would hardly move the needle). We still treat them as higher risk – hence only 1% stakes. **Moonshot sleeve – unchanged:** While one proposal considered dropping the Moonshot to simplify, we decided its potential payoff warranted keeping it. We did **tighten our Moonshot risk management rules** (e.g. laddering expiries, taking partial profits at 65–75% of max value) to ensure we capture gains when available and keep the tail-risk *truly* asymmetric (all losses contained in that 10%)*[13]*.

Overall, the **Event Horizon Fund remains ~50% of total investments**, with the Foundation and Continuity Funds unchanged (the other ~50% in broad index funds and safe assets). Within EHF, the **Moonshot sleeve is firmly 10%** of EHF capital as requested, and each individual stock position is **≤15%** (CEG at 15% is the only max-weight). The above changes tilt the fund more towards the **upstream, capacity-constrained "money picks"** of the AI revolution and

trim out lower-conviction or duplicative holdings. We expect these adjustments to **enhance the Fund's total return** if our AI-2027 scenario comes to pass, by amplifying exposure to the highest-return segments (power, HBM memory, critical equipment) and eliminating dilution from fringe positions. Importantly, these moves do not materially increase risk beyond our intended profile – rather, they concentrate risk into areas we have highest confidence in, which is appropriate given the scenario clarity. We will, of course, **monitor real-world data** (e.g. AI chip supply metrics, PPA deals, hyperscaler capex, etc.) closely each quarter*[159][160]* to ensure our thesis is tracking; any sign that a "must happen" assumption is failing (for instance, if **HBM4 development falters or nuclear plant uptime issues emerge**) would trigger a re-evaluation or trim as noted in our sleeve discussions.

Final Proposed Event Horizon Fund Allocation: *(by sleeve and stock, post-optimization)*

- **Foundry & Advanced Packaging (12%):** TSMC – 12%
- **Accelerators & Custom Silicon (10%):** NVIDIA – 7%; Broadcom – 3%
- **HBM Memory (7%):** Micron – 7%
- **Semiconductor Equipment (11%):** ASML – 8%; Applied Materials – 3%
- **EDA Software (4%):** Synopsys – 4%
- **AI Networking Fabric (5%):** Arista Networks – 5%
- **Rack-Scale Integration & Cooling (14%):** Vertiv – 8%; Dell – 6%
- **Energy & Power (17%):** Constellation Energy – 15%; Quanta Services – 2%
- **AI-Native Security (2%):** CrowdStrike – 2%
- **AI Operate & Control (2%):** Palantir – 2%
- **AI-Enabled Defense (2%):** AeroVironment – 1%; Kratos Defense – 1%
- **Bio-Risk Hedge (1%):** Moderna – 1%
- **Strategic Materials (3%):** MP Materials – 3%
- **Moonshot Tail-Risk Sleeve (10%):** *LEAP call spreads & high-upside plays:* Intel (3.5%), Crypto datacenter/hosting (CoreWeave/IREN/APLD combined 3.5%), Kratos (2.0%), Moderna (1.0%) – max loss limited to 10%, with multi-x payoff potential*[84][85]*. *(Moonshot positions are unchanged and managed under strict risk limits.)*

This **optimized Event Horizon Fund** is positioned to capture the outsized value accruing to the **physical enablers of AI** – those firms controlling the energy, materials, and infrastructure without which the AI revolution cannot progress. If the AI-2027 scenario unfolds as expected,

the Fund should deliver exceptional absolute returns, driven by the scarcity-driven pricing power of its holdings. By 2030, we anticipate the Event Horizon Fund will be a primary engine of our overall portfolio's growth – its concentrated bets are precisely in the areas where **demand-supply imbalances are greatest** and thus where **shareholder value should accrete the fastest***[22]*. We have high confidence that this allocation maximizes our chances of achieving the **most optimal total return outcome** under the AI-2027 thesis, while still respecting prudent risk management (position limits and diversification across key themes). We will remain vigilant and ready to adjust if reality deviates from the forecast, but as it stands, the **Event Horizon Fund (V7)** is ready to be funded and to capitalize on what we see as a *historic investment opportunity* at the intersection of AI and the physical world's constraints.

---
